

444 Lecture 1

Course Overview

Brian Weatherson

1/5/23

Plan

- To introduce the outlines of the course, and to say a little bit about games.

Day Plan

Course Overview

Games

Three Parts of Course

1. Game Theory

Three Parts of Course

1. Game Theory
2. Origins of Unfairness

Three Parts of Course

1. Game Theory
2. Origins of Unfairness
3. Group attitudes

Game Theory

Giacomo Bonanno

Giacomo Bonanno, Game Theory

Aims

- Familiarity with the basic math of game theory.

Aims

- Familiarity with the basic math of game theory.
- Introduce some famous examples of simple game theoretic models that get used throughout academic work.

Aims

- Familiarity with the basic math of game theory.
- Introduce some famous examples of simple game theoretic models that get used throughout academic work.
- Look at some attempted explanation of real world phenomena using game theoretic tools, and go over the strengths and weaknesses of these explanations.

Cailin O'Connor, The Origins of Unfairness

Aims

- Look at game theoretic models of the origin of unequal gender distributions.

Aims

- Look at game theoretic models of the origin of unequal gender distributions.
- Ask whether these models are plausible in light of the facts about how this kind of inequality manifests in the real world.

Aims

- Look at game theoretic models of the origin of unequal gender distributions.
- Ask whether these models are plausible in light of the facts about how this kind of inequality manifests in the real world.
- And in particular, look at the different kinds of gender inequality in different parts of life (in particular in workforces vs in households) and look at whether the models are as plausible in each case.

The 2020 PhilPapers Survey is here!

posted 2020-10-15 by David Bourget

We are pleased to announce the public launch of the 2020 PhilPapers Survey. The survey is a follow-up on the 2009 PhilPapers Survey, which was first conducted in September 2009. As with the previous survey, the primary aim of the survey is to discover information about the distribution of philosophical views among professional philosophers in the English-speaking world. Everyone is welcome to... [\(read more\)](#)

Happy birthday PhilPapers!

posted 2019-01-28 by David Bourget

Todays [January 28, 2019] is PhilPapers tenth birthday. PhilPapers has grown enormously since its modest beginnings at the ANU. In the first months we had only a few thousand users. Now we have over 270,000 registered users. We started by indexing a relatively small number of articles that were readily available online. Now we have by far the most complete index of... PhilPeople is here

posted 2018-05-09 by David Bourget

We have just launched a beta testing version of our new professional and social network for philosophers developed by the PhilPapers foundation with support from the American Philosophical Association. Visit the site to find out more!

Welcome to PhilPapers

PhilPapers is a comprehensive index and bibliography of philosophy maintained by the community of philosophers. We monitor all sources of research content in philosophy, including journals, books, open-access archives, and personal pages maintained by academics. We also host the largest open-access archive in philosophy. Our index currently contains 2,539,190 entries categorized in 5,647 categories. PhilPapers has over 270,000 registered users.

About us

PhilPapers

Aims

- Ask whether groups can have attitudes like beliefs, desires, goals, intentions, plans and so on.

Aims

- Ask whether groups can have attitudes like beliefs, desires, goals, intentions, plans and so on.
- Along the way, ask what it means to answer this question positively or negatively.

Aims

- Ask whether groups can have attitudes like beliefs, desires, goals, intentions, plans and so on.
- Along the way, ask what it means to answer this question positively or negatively.
- And, if we have the time, ask what a positive answer would mean for our theories of knowledge, responsibility, and so on.

Schedule

- Seven weeks on game theory

Schedule

- Seven weeks on game theory
- Three weeks on unfairness

Schedule

- Seven weeks on game theory
- Three weeks on unfairness
- Three weeks on group attitudes

Schedule Quirk

- I'm away on January 27, and working around this led to some complications with the schedule.

Schedule Quirk

- I'm away on January 27, and working around this led to some complications with the schedule.
- You'll see things described as 'units' not weeks for a little bit on the syllabus, because sometimes the material on a Thursday goes best with the following Tuesday.

Schedule Quirk

- I'm away on January 27, and working around this led to some complications with the schedule.
- You'll see things described as 'units' not weeks for a little bit on the syllabus, because sometimes the material on a Thursday goes best with the following Tuesday.
- And for a couple of weeks, the assignments are a little 'behind' the lectures.

Schedule Quirk

- I'm away on January 27, and working around this led to some complications with the schedule.
- You'll see things described as 'units' not weeks for a little bit on the syllabus, because sometimes the material on a Thursday goes best with the following Tuesday.
- And for a couple of weeks, the assignments are a little 'behind' the lectures.
- But we catch up around February 15.

Schedule Luck

- The Spring Break falls precisely at the right time for this course; just as we switch from the more mathematical part to the more discursive part.

Schedule Luck

- The Spring Break falls precisely at the right time for this course; just as we switch from the more mathematical part to the more discursive part.
- I'd like to claim this was great course design, but it was actually a bit of luck.

Assessment

- Do six small assignments on game theory (the best five will count).

Assessment

- Do six small assignments on game theory (the best five will count).
- Write an 8-10 page paper (about 2000 words) on a question from the latter two topics

Assessment

- Do six small assignments on game theory (the best five will count).
- Write an 8-10 page paper (about 2000 words) on a question from the latter two topics
- Each of these will be half of the grade.

Day Plan

Course Overview

Games

Games

- A **game** is any situation where the outcome is determined by the actions of the players, plus perhaps some impact from the outside world.
- If this seems really general, it is!

Formal games

In a formal representation of a game we specify:

- How many players there are.

Formal games

In a formal representation of a game we specify:

- How many players there are.
- How many moves they each have.

Formal games

In a formal representation of a game we specify:

- How many players there are.
- How many moves they each have.
- What order those moves get made in.

Formal games

In a formal representation of a game we specify:

- How many players there are.
- How many moves they each have.
- What order those moves get made in.
- How many options they have at each move.

Formal games

In a formal representation of a game we specify:

- How many players there are.
- How many moves they each have.
- What order those moves get made in.
- How many options they have at each move.
- What the payoff is for each player for each possible combination of moves by the players and 'moves' by nature.

Two Main Types

- Each player makes 1 move, and these are made simultaneously.

Two Main Types

- Each player makes 1 move, and these are made simultaneously.
- Players take turns making moves, and every move is revealed to all players when they are made.

An example of a turn taking game

An example of a one move game

A more familiar one move game

Other Types

- Nature gets involved.
- Nature gets involved and their move is only revealed to one of the players.
- A move made by a player is not revealed to the other player(s) straight away.
- Multiple sequential moves.

How nature can get involved in a public way.

How nature can get involved in a private way.

Moves that are not revealed

Multiple simultaneous moves

Positive Sum Game

- These instances are a bit non-representative in one crucial respect.

Positive Sum Game

- These instances are a bit non-representative in one crucial respect.
- They are all **zero-sum**.

Positive Sum Game

- These instances are a bit non-representative in one crucial respect.
- They are all **zero-sum**.
- That is, someone doing well means someone else must be doing worse.

Positive Sum Game

- These instances are a bit non-representative in one crucial respect.
- They are all **zero-sum**.
- That is, someone doing well means someone else must be doing worse.
- This is not the general case.

Positive Sum Game

Most of the games we're going to look at have the following characteristic.

- There is a pair of possible outcomes such that every player is better off in the first outcome than the second.

For Next Time

We're going to get a bit clearer on what this last claim means, and how it affects how we write up games.
